January 2024

Carpophilus Beetle

The January issue of the Pacific Nut Producer magazine included a detailed article about an invasive beetle that has been found in almonds and pistachios in the northern and central part of our San Joaquin Valley. The carpophilus beetle is one of the top pests in Australian almonds and has spread to our country. The article is lengthy from research done by the University of California Cooperative Extension. It indicates the California infestations were found in **Stanislaus, Merced, Madera, and King** counties.

The article stresses the key to managing the infestation is crop sanitation, particularly in the winter. You can read the entire article on pages 8-13 in the magazine or click this [link](#) to listen to a short video or visit this site: <https://pacificnutproducer.com/2023/12/18/new-invasive-pest-threatens-western-tree-nut-industry/>

Market Report

The New Year is here and the first month is almost gone! We received the last of the 2023 crop mid-December and we are already talking bees and bloom for February! We will share a few thoughts with you regarding this "in between time".

Based on the December Position report which came out on 1/11/24, crop receipts received in December outnumbered other December receipts since 2020. **Is that because the crop will meet the estimate of 2.6 billion?** Oh no, it is because the harvest ran SOOOOOO late, and hulling/shelling ran slower (which equates to more time) due to the excessive inedible kernels being pulled out. At this point, the total incoming is 2.2 billion pounds (under the estimate by four billion pounds). Total supply is 2.9 billion pounds because of the huge carry over coming into the 2023 crop year.

Shipments for December exceeded expectations for export and domestic. Valley Harvest December shipping was up 15% over November and we were closed six work days in between Christmas and New Years. (This was the first year we closed

between the holidays as most processors do.) If buying and shipping maintains the current standard, we will use up the 2023 crop and 2022 carry in and go into 2024 with a manageable carry in as in the past. At least, at this point, that is the expectation.

The prices are firm and have increased in some areas slightly. With the lighter crop, kernel sizes are larger than usual. Therefore, the demand for the smaller almonds puts pressure on the market in trying to satisfy buyer requests. Some of the price increase is with the smaller sized almonds. The larger sizes are plentiful, so we haven't seen a high price increase there. The inedible count in the industry is up 100% from last year and that puts pressure on increased sorting and testing. Extra labor costs to create the same quality product as in the past keeps processors from wanting to lower selling prices. Finding the happy medium between sellers and buyers keeps the tension high. But then that is the commodity world. We continue to play the balance game on your behalf, our favorite almonds growers!

The Almond Board of California is advancing California almonds through innovation. Their website is full of ways to 'consume' almonds. They have discovered more uses than simply eating delicious, nutritious almonds including marketing almonds as a way to reduce wrinkles. Based on the December Position report which came out on 1/11/24, crop receipts received in December outnumbered other December receipts since 2020. **Is that because the crop will meet the estimate of 2.6 billion?** Oh no, it is because the harvest ran SOOOOOO late, and hulling/shelling ran slower (which equates to more time) due to the excessive inedible kernels being pulled out. At this point, the total incoming is 2.2 billion pounds (under the estimate by four billion pounds). Total supply is 2.9 billion pounds because of the huge carry over coming into the 2023 crop year.

Shipments for December exceeded expectations for export and domestic. Valley Harvest December shipping was up 15% over November and we were closed six work days in between Christmas and New Years. (This was the first year we closed

between the holidays as most processors do.) If buying and shipping maintains the current standard, we will use up the 2023 crop and 2022 carry in and go into 2024 with a manageable carry in as in the past. At least, at this point, that is the expectation.

The prices are firm and have increased in some areas slightly. With the lighter crop, kernel sizes are larger than usual. Therefore, the demand for the smaller almonds puts pressure on the market in trying to satisfy buyer requests. Some of the price increase is with the smaller sized almonds. The larger sizes are plentiful, so we haven't seen a high price increase there. The inedible count in the industry is up 100% from last year and that puts pressure on increased sorting and testing. Extra labor costs to create the same quality product as in the past keeps processors from wanting to lower selling prices. Finding the happy medium between sellers and buyers keeps the tension high. But then that is the commodity world. We continue to play the balance game on your behalf, our favorite almonds growers!

The Almond Board of California is advancing California almonds through innovation. Their website is full of ways to 'consume' almonds. They have discovered more uses than simply eating delicious, nutritious almonds including marketing almonds as a way to reduce wrinkles. January 2024

Carpophilus Beetle

The January issue of the Pacific Nut Producer magazine included a detailed article about an invasive beetle that has been found in almonds and pistachios in the northern and central part of our San Joaquin Valley. The carpophilus beetle is one of the top pests in Australian almonds and has spread to our country. The article is lengthy from research done by the University of California Cooperative Extension. It indicates the California infestations were found in **Stanislaus, Merced, Madera, and King** counties.

The article stresses the key to managing the infestation is crop sanitation, particularly in the winter. You can read the entire article on pages 8-13 in the magazine or click this [link](#) to listen to a short video or visit this site: <https://pacificnutproducer.com/2023/12/18/new-invasive-pest-threatens-western-tree-nut-industry/>

Market Report

The New Year is here and the first month is almost gone! We received the last of the 2023 crop mid-December and we are already talking bees and bloom for February! We will share a few thoughts with you regarding this "in between time".

Based on the December Position report which came out on 1/11/24, crop receipts received in December outnumbered other December receipts since 2020. **Is that because the crop will meet the estimate of 2.6 billion?** Oh no, it is because the harvest ran SOOOOOO late, and hulling/shelling ran slower (which equates to more time) due to the excessive inedible kernels being pulled out. At this point, the total incoming is 2.2 billion pounds (under the estimate by four billion pounds). Total supply is 2.9 billion pounds because of the huge carry over coming into the 2023 crop year.

January 2024

Carpophilus Beetle

The January issue of the Pacific Nut Producer magazine included a detailed article about an invasive beetle that has been found in almonds and pistachios in the northern and central part of our San Joaquin Valley. The carpophilus beetle is one of the top pests in Australian almonds and has spread to our country. The article is lengthy from research done by the University of California Cooperative Extension. It indicates the California infestations were found in **Stanislaus, Merced, Madera, and King** counties.

The article stresses the key to managing the infestation is crop sanitation, particularly in the winter. You can read the entire article on pages 8-13 in the magazine or click this [link](#) to listen to a short video or visit this site: <https://pacificnutproducer.com/2023/12/18/new-invasive-pest-threatens-western-tree-nut-industry/>

Market Report

The New Year is here and the first month is almost gone! We received the last of the 2023 crop mid-December and we are already talking bees and bloom for February! We will share a few thoughts with you regarding this "in between time".

Based on the December Position report which came out on 1/11/24, crop receipts received in December outnumbered other December receipts since 2020. **Is that because the crop will meet the estimate of 2.6 billion?** Oh no, it is because the harvest ran SOOOOOO late, and hulling/shelling ran slower (which equates to more time) due to the excessive inedible kernels being pulled out. At this point, the total incoming is 2.2 billion pounds (under the estimate by four billion pounds). Total supply is 2.9 billion pounds because of the huge carry over coming into the 2023 crop year.

Shipments for December exceeded expectations for export and domestic. Valley Harvest December shipping was up 15% over November and we were closed six work days in between Christmas and New Years. (This was the first year we closed

between the holidays as most processors do.) If buying and shipping maintains the current standard, we will use up the 2023 crop and 2022 carry in and go into 2024 with a manageable carry in as in the past. At least, at this point, that is the expectation.

The prices are firm and have increased in some areas slightly. With the lighter crop, kernel sizes are larger than usual. Therefore, the demand for the smaller almonds puts pressure on the market in trying to satisfy buyer requests. Some of the price increase is with the smaller sized almonds. The larger sizes are plentiful, so we haven't seen a high price increase there. The inedible count in the industry is up 100% from last year and that puts pressure on increased sorting and testing. Extra labor costs to create the same quality product as in the past keeps processors from wanting to lower selling prices. Finding the happy medium between sellers and buyers keeps the tension high. But then that is the commodity world. We continue to play the balance game on your behalf, our favorite almonds growers!
